YUTIEN HYDRAULIC

YUTIEN
HYDRAULIC

PHILOSOPHY

YUTIEN Company has many years of experience in the combined application of hydraulic components and hydraulic power, coupled with continuous investment in expertise and capital to improve production technology and quality. The product quality is now comparable to that of European, American, and Japanese products. And adhering to the continuous improvement of quality and service enthusiasm.

We not only provide customers with hydraulic parts requirements, but also provide customers with combination suggestions for different regional markets or different product applications. After passing the ISO 9001:2015 international quality certification, we look forward to serving customers with high standards of quality.

COMPANY PROFILE

YUTIEN HYDRAULIC was established in 1971, committed to the production of hydraulic parts and the design of automation systems and power combinations. In 1980, YUTIEN Company took the lead in developing the hydraulic power combination in Taiwan and cooperated with various machinery factories in the production of special projects.

The products and power combinations produced have been distributed all over the world. Although YUTIEN Company does not have the scale of a large enterprise, we have accumulated nearly 50 years of technical experience, and we can be regarded as the initiator and pioneer of hydraulic machinery in Taiwan.

HISTORY

1980

Established related firm "Shuo-Yuan Industry Co., Ltd."

- Producing hydraulic components.
- The pioneer of those who developed power units in Taiwan.

And further started to provide customized services to meet each unique client.

1996

Invested "THAI HYDRAULIC TUBE CO., LTD." in Thailand.

- THAI HYDRAULIC TUBE Company which runs hydraulic pipes, special machines and YUTIEN brand's components and power units' business.

1971

Established "New Wu-Jou Hydraulic Machine Factory".

Producing hydraulic components and designing hydraulic special purpose machines.

1982

- Company restructuring and changed a new name to "YUTIEN Hydraulic Industry Co., Ltd."

YUTIEN HYDRAULIC continues to engage in the manufacture of hydraulic components and power units, automotive system design, and further expands the import and export trade business of hydraulic components of multiple brands.

2006

- Passed ISO 9001:2000 certification. Offer much more systematic and efficient service.
- Established the office and maintaining center "Pei-Guan Hydraulic Industry Co., Ltd." in Xiamen. Provide express shipping and good after-sales service for the Chinese market.

2012

- The Taiwan head office and production plant relocated to a new facility in Wuri District, Taichung City.
(The production area is about 6,500 square meters)

2003

- Established "Pei-Ying Hydraulic Industry Co., Ltd." in Foshan as our first China office.

2008

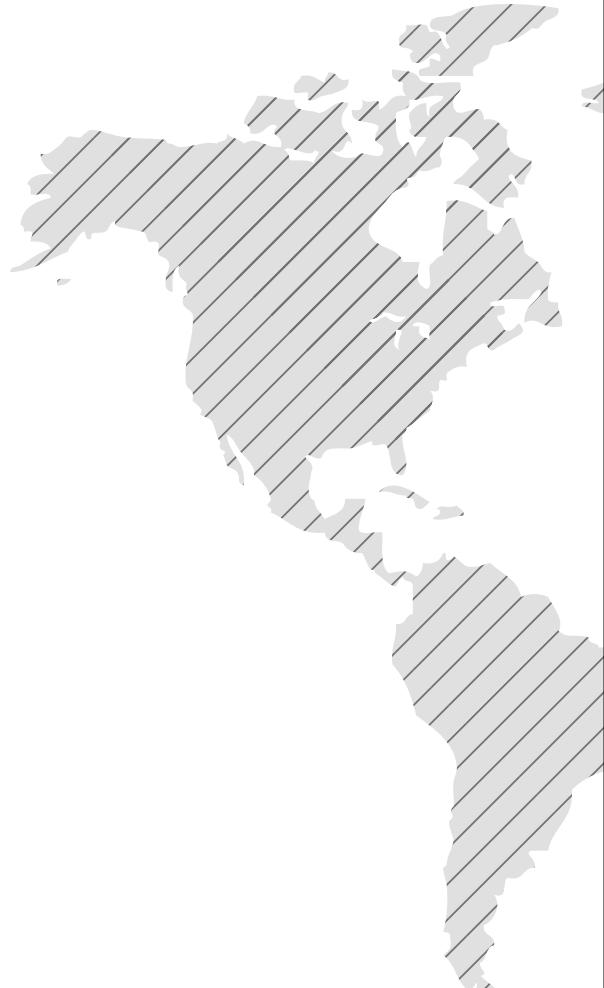

Established direct sales office in Shanghai, China.

2018

Passed the new version of international ISO 9001:2015 certification.

OUR CLIENTS

- The Aerospace Ind. Development Corp.
- NANYA Plastic Corp
- TAITA Chemical Company Ltd.
- FORMOSA Chemical & Fabric Corp.
- TAIWAN GLASS Ind. Corp.
- CHUNGHWA Telecom
- CHIH-LIEN Industrial Co., Ltd.
- TAH-CHUNG Steel Corp.
- TSAN KUN Trans-National Group.
- LEN-HWA Textile Co., Ltd.
- CAU-CHING-CHYUAN Co., Ltd.
- CHENG-LOONG Corp.
- Institute of Transportation. MOTC
- TAICHUNG Thermal Power Plants.
- TAIWAN-TAITUNG Irrigation Association
- TAIWAN NAN-TOU Irrigation Association.
- HSIUPING University of Science and Technology

Solenoid Operated Directional Control Valves

JIS-Graphic Symbol

A

Feature

- The main body has double grooves for oil return to increase the passing flow and the operating pressure.
- New CNC precision machining, accurate size. With non-right-angle spool designed to reduce the cutting edge or sliding block issues caused by high pressure.
- Internal resistance is greatly increased.
- Internal back pressure is greatly increased.
- Oil-immersed type solenoid design with stable action and low noise.

- One-piece coil, with good water-proof effect, good heat dissipation and high temperature resistance.
- 3-positions/4-ways or 2-positions/4-ways spool type directional control valve operated by 5-hole solenoid. Suitable for block or base plate installation.
- Solenoid valve installation dimensions are in line with international standards.
- With neon light to indicate the direction of action.
- DIN Type plug-in and Terminal Box type connection, with direction indicator light on both sides.

In-Line Check Valves

JIS-Graphic Symbol

Feature

- When the pressure reaches the cracking pressure, the oil flow will freely, and completely prevent reverse flow.
- Can be used as a safety device for cooler and return oil filters.
- Gravity-type check valve can be used as an external pressure relief for other control valves and maintain the valves with normal operation.

PF Series Prefill Valves

JIS-Graphic Symbol

Feature

- Simple structure, Long service life, Easy installation.
- The internal force is shared by the three-arms, and the quality is reliable.
- Low pressure drops, Large flow.

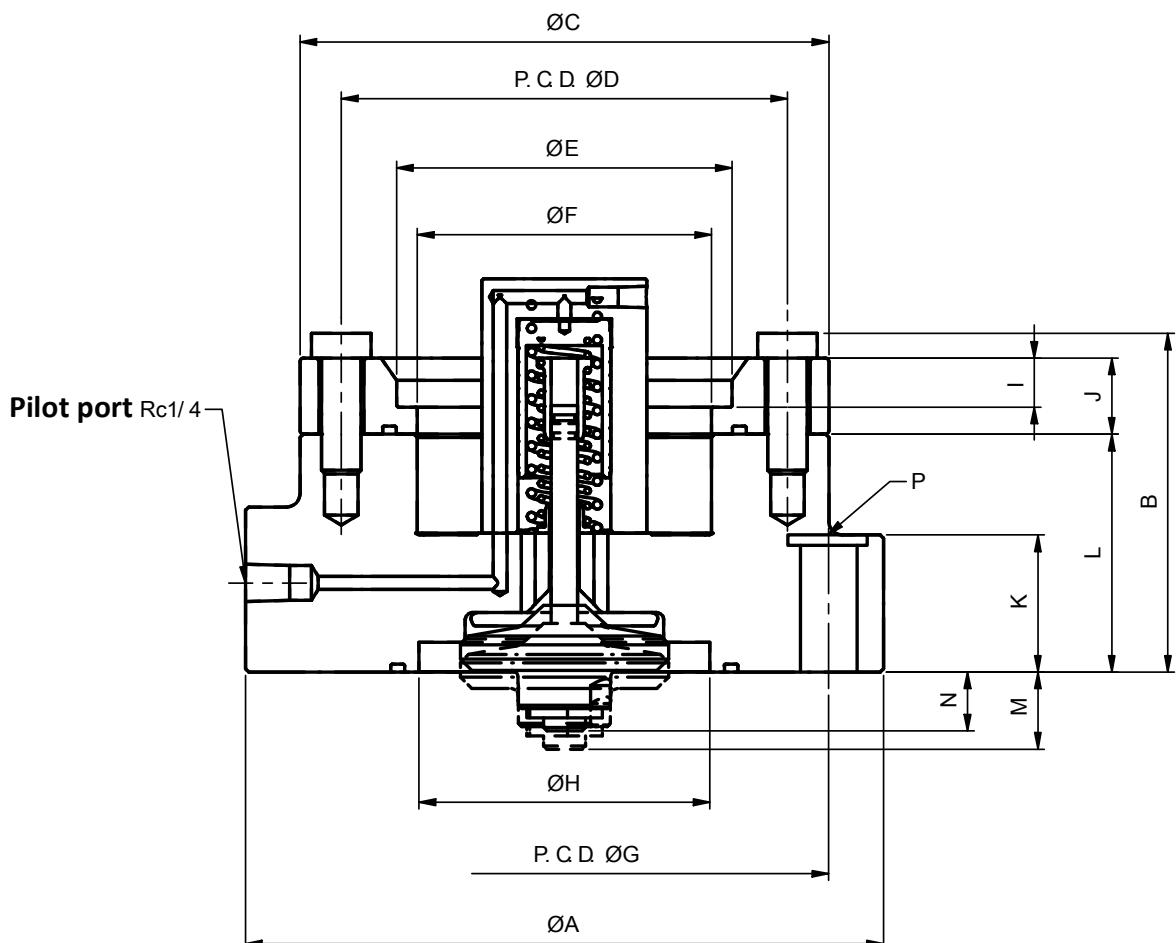

- The prefabricated valve is small size with large flow and no leakage. Be sure to release the pressure before operating, otherwise it will not work.

SG Series Prefill Valves

JIS-Graphic Symbol

Feature

- The prefill valve is generally used as oil input and output between the hydraulic cylinder and the tank. In the fast stroke of large presses, the oil needs to be taken from the cylinder, and prevents the oil flowing from cylinder to the tank when pressurized, or the other way oil flow backs to the tank.
- Commonly used in large presses and injection molding machines as an oil supply tank; can use a small pump for fast movement. When the cylinder is running fast, it fills the cylinder with a large amount of oil from the tank. During pressurization, the return flow from the cylinder to the tank can be cut off. When the cylinder returns, the pilot control pressure forces the Prefill Valve to open and direct oil from the cylinder back to the tank.

Instructions

- Pressure Adjustment:** When adjusting the pressure, loosen the lock nut, turn the handle slowly, clockwise is the pressure increase, counterclockwise is the pressure decrease, please don't forget to tighten the fixing nut after the adjustment.
- Oil return method:** The oil pipes of the direct-controlled type and remote-controlled type should not connect with other valves but should be directly connected to the tank. If the internal volume in the oil pipes is too large, buffeting is likely to occur. Therefore, the length and diameter of the piping should be minimized.
- Flow selection:** When the flow is small, the adjustment pressure will be unstable.
When using threaded code size 03 and 06, the flow rate should be greater than 5L/min,
When using threaded code size 10, the flow rate should be greater than 8L/min.

Pressure Control Valves
Low Noise Type Pilot Operated Relief Valves

Solenoid Controlled Pilot Operated Relief Valves

JIS-Graphic Symbol

B

Pressure Control Valves
Solenoid Controlled Pilot
Operated Relief Valves

Feature

- The combination of the relief valve and the solenoid operated directional valve, since the solenoid valve is directly installed on the relief valve, and is linked to the vent port, thus it does not require extra relief pipes. Pump pressure can

be remotely unloaded by the electronic signal from the solenoid valve or adjusted by connecting a pilot relief valve to the solenoid valve port. The system gets variable-pressure or three-stage pressure control.

Specification

Model /Type	Operating Pressure (Max.) Kgf/cm ²	Pressure Adjustment Range Kgf/cm ²	Rated Flow (Max.) L/min
U**-03		1 : 5-70 2 : 35-140 3 : 70-210 4 : 140~210	60
U**-06	210		120
U**-10			240

Valve Type

(U) Valve	II: Low-Pressure Relief Valve	IE: Sequence Valve	EE: Sequence Valve	EI: Unloading Valve
Pilot / Drain Type	Internal Pilot-Internal drain	Internal Pilot-External drain	External Pilot-External drain	External Pilot-Internal drain
Operations				
JIS-Graphic Symbol				
Instructions	When the internal pilot pressure exceeds the pressure setting, the balance piston rises. The primary and secondary pressure circuits are opened, and the secondary pressure is connected to the tank and becomes a direct relief valve. This valve is installed with very few hydraulic circuits.	This sequence of actions is based on two or more differences in the hydraulic circuit. This valve is internal pilot pressure operate in sequence, if you want to use the pressure to reverse the free flow back to the primary pressure, you should use a sequence valve with a check.	External pilot and drain operation, which acts the same as a sequence valve (IE) type.	This valve is the most used of the four types. The combined output of the high-flow low-pressure pump and the small-flow high-pressure pump makes the hydraulic cylinder move quickly. When the hydraulic cylinder reaches a higher pressure, the pressure of the high-pressure pump pilot unloading valve causes the balance piston to rise. The flow is drained back to the tank by the low-pressure pump, with no load on the pump.

(UC) Valve	II: Counterbalance Valve	IE: Sequence Valve (With Check Valve)	EE: Sequence Valve (With Check Valve)	EI: Counterbalance Valve
Pilot / Drain Type	Internal Pilot-Internal drain	Internal Pilot-External drain	External Pilot-External drain	External Pilot-Internal drain
Operations				
JIS-Graphic Symbol				
Instructions	The counterbalance valve is also known as back pressure valve. When the vertical hydraulic cylinder has a heavy load, it will automatically descend, or the descending speed exceeds the control. This valve can apply back pressure to the hydraulic cylinder, which reduces the load balance. When the hydraulic cylinder rises, the built-in check valve can be used to reverse the flow direction.	When there is more than one hydraulic circuit, this valve can make two or more hydraulic cylinders operate in sequence according to the pressure of the internal pilot, with a check valve inside, the flow in the reverse direction, so the valve system is pilot internally, and the Cylinder-A is actuated Cylinder-B can also be actuated at the same time.	The valve function is the same as the (IE) type, with a check valve inside, and the flow can also be reversed. When the A-cylinder work is completed, the external pilot makes the B-cylinder start to work.	The valve function is the same as the (II) type, with a check valve inside, and the flow can also be reversed. When the speed of the hydraulic cylinder is fast or the load is unstable, the action will be unbalanced, so it is not often used.

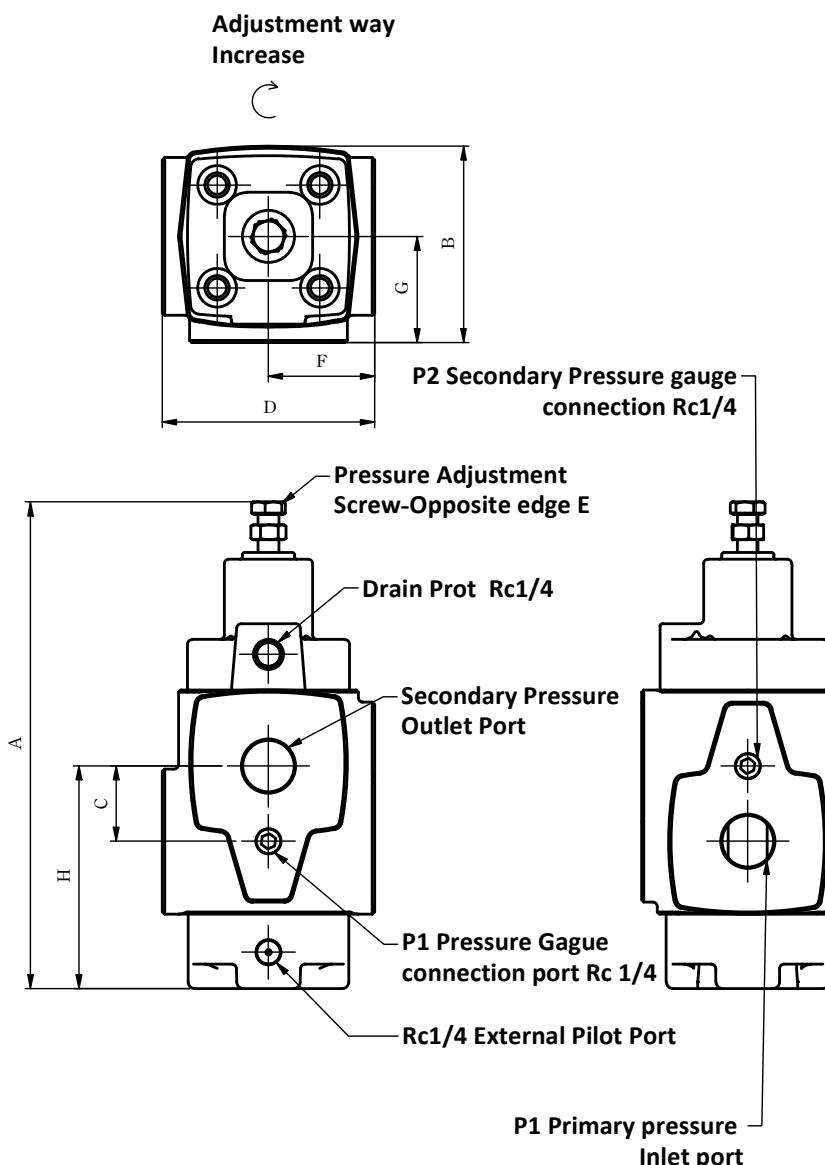

Note:

- When adjusting the pressure, loosen the lock nut, turn the handle slowly, clockwise is the pressure increase, counterclockwise is the pressure decrease, please don't forget to tighten the fixing nut after the adjustment.
- The secondary pressure outlet of the internal drain and the external drain are needs to with a low back pressure that close to the atmospheric pressure, and directly return to the tank.

JIS-Graphic Symbol

Feature

- URG series counterbalance valve is based on the research and improvement of the current deep-drawing press, which prevents the self-weight balance from being slow, too noisy, the back

pressure control of the plastic injection machine is not accurate, and excessive pressure losses. Can be used in various hydraulic devices to prevent back pressure such as heavy drop.

Model 説明

UR	G	-03	-3
Model /Series	Installation Type	Thread Code Size (Inch)	Pressure Adjustment Range Kgf/cm ²
Counterbalance Valves	G: Sub-Plate Mounting	03 : 3/8" 06 : 3/4" 10 : 1-1/4"	1 : 7-70 2 : 35-140 3 : 70-210

Specification

Model / Type	Operating Pressure (Max.)Kgf/cm ²	Pressure Adjustment Range Kgf/cm ²	Rated Flow (Max.) L/min	Cracking Pressure Kgf/cm ²
URG-03	250	1 : 7-70 2 : 35-140 3 : 70-210	60	3.5
URG-06			125	
URG-10			250	

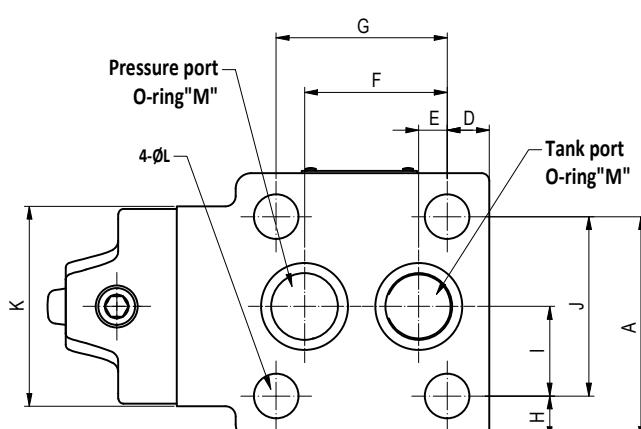

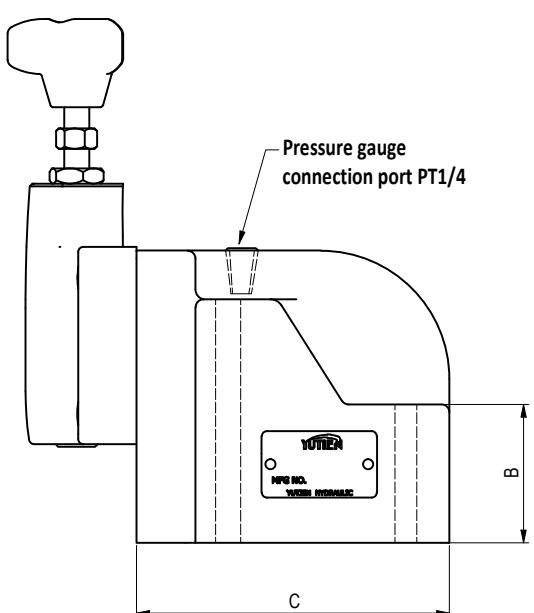

Note: Maximum Flow rates are approximation when the valve is fully loaded, the oil specific gravity of 0.85, an operating viscosity of 20 cSt, and the Maximum pressure drop of 30 kgf/cm² at input /output ports.

Instructions

- Pressure Adjustment:** When adjusting the pressure, loosen the lock nut, turn the handle slowly, clockwise is the pressure increase, counterclockwise is the pressure decrease, please don't forget to tighten the fixing nut after the adjustment.
- Oil return method:** The oil return pipe should not connect with other valves but should be directly connected to the tank. If it is used to control the pressure of the remote-control valve, the internal volume of the oil pipes is too large, buffeting is likely to occur. Therefore, the length and diameter of the piping should be minimized.

Restrictors

JIS-Graphic Symbol

Feature

- The restrictor is used for speed regulation of the actuator in the pressure system and should be constant pressure in the circuit line. As the pressure changes through this valve, it will have

small flow fluctuations.

- With check valve function can control the direction of flow at the same time.

Model Description

TV	C	G	-03
Model /Series	Check Function	Installation Type	Thread Code Size (Inch)
Restrictors	None: Not Required C: Check Valve	T : Threaded Connections G : Sub-Plate Mounting	03 : 3/8" 04 : 1/2" 06 : 3/4" 08 : 1" 10 : 1-1/4"

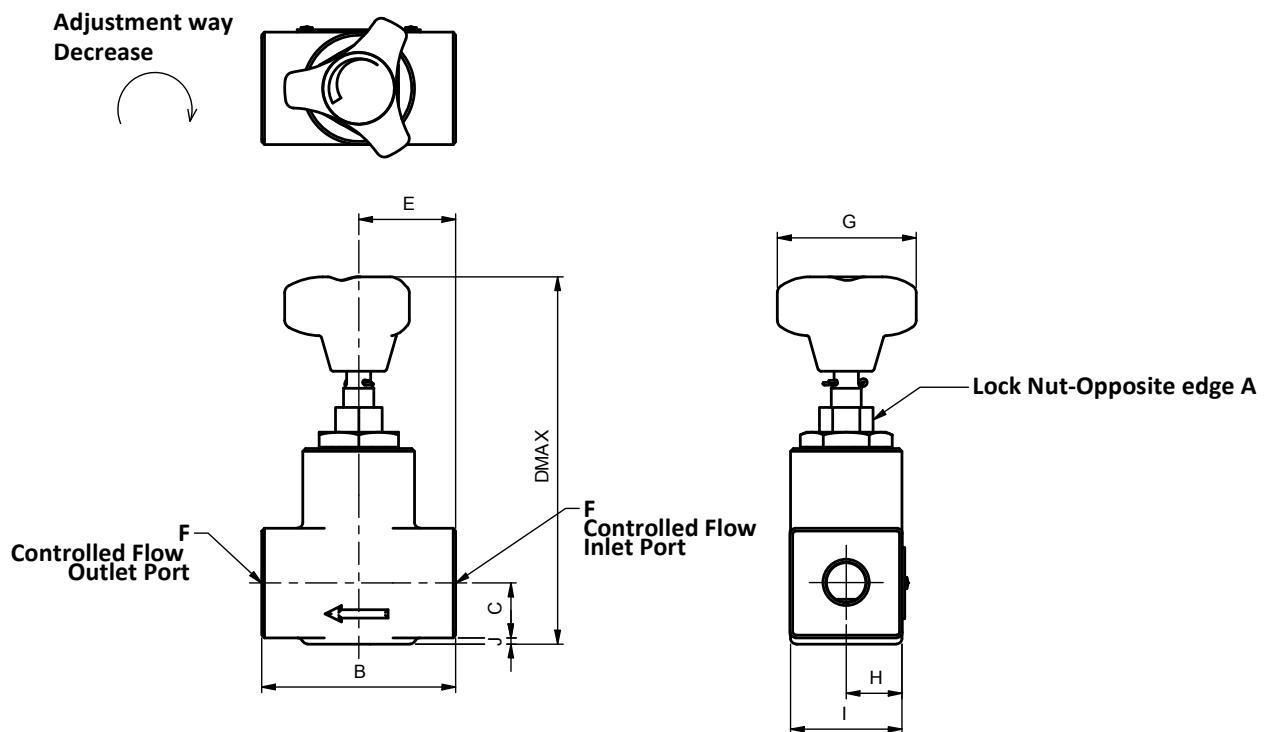

Note: The rated flow is measured by the pressure drop of 3kg/cm² at the outlet port.

In-Line Throttle Valves

JIS-Graphic Symbol

Feature

- The steel working body can withstand pressure up to 210Kg/cm²
- All have been pressure resistance and leak-proof tested, no leakage.

- The internal processing is precise, and the flow regulation speed is linear.

Flow Controlled and Check Valves

JIS-Graphic Symbol

Feature

- The flow control and check valve can adjust the flow in one direction and can flow freely in the reverse direction. There is a clear scale on the nameplate, which can be easily adjusted or reset

the flow rate.

- It is suitable for fast, slow, and fast return of the control system, especially for tool machinery.

Solenoid Controlled Pilot Operated Restrictors

JIS-Graphic Symbol

Feature

- Combined with Throttle Valve and Solenoid Directional Valve. There are six types according to the combination and flow adjustment. Commonly used in plastic injection molding and hydraulic machine tools.
- SF series is Two-stage speed control valve, and free flow. While the solenoid is energized, it controls the flow rate. Applied to systems that require Two-stage (Slow/Fast) speed control.
- SDF series is Single-stage speed control valve, and the flow is Normally Closed (NC). While the solenoid is energized, it controls the flow rate. Applied to electrical signal controls the actuator (ON/OFF) and requires speed control.

- SKF type is Three-stage solenoid speed control valve. Applied to systems that require (Slow/ Fast/ Rapid) speed control.
- SFD series is Two-stage solenoid speed control valve. Applied to the systems requires (Slow/ Fast) speed control.
- SD series is Normally Closed (NC), and it is free flow when the solenoid is energized.
- THF series has only throttle function without solenoid directional valve.

Proportional Electro-Hydraulic Pilot Relief Valves

JIS-Graphic Symbol

Feature

- Simplify the hydraulic system circuit, break through the traditional complex circuit of "one-pressure with one-remote control valve".
- The proportional coil can produce step-less pressure based on the input current and bring out

the best function of combination the hydraulics and electronics.

- With fast response function, transient pressure changes are small, which can reduce pipeline resonance.

Model Description

EDG	-01	-C
Model /Series	Thread Code Size (Inch)	Pressure Adjustment Range kgf/cm ²

Proportional Electro-Hydraulic Pilot Relief Valves

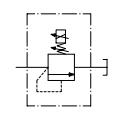

01 : 1/8"

C : 140
H : 210

Specification

Model	Operating Pressure (Max.) kgf/cm ²	Rated Flow (Max.) L/min	Flow Adjustment Range (Max.) L/min	Allowable Back Pressure kgf/cm ²
EDG-01	210	2	C : 8~140 H : 10~210	Note
Rated Current (mA)	Coil Resistance Ω	Hysteresis %	Reproducibility %	Weight Kg
C : 750 H : 700	10	< 3	< 0.5	2

Note: The resistance of the return line should be cut down by using only one pipe insert into the tank (below the oil level) directly.

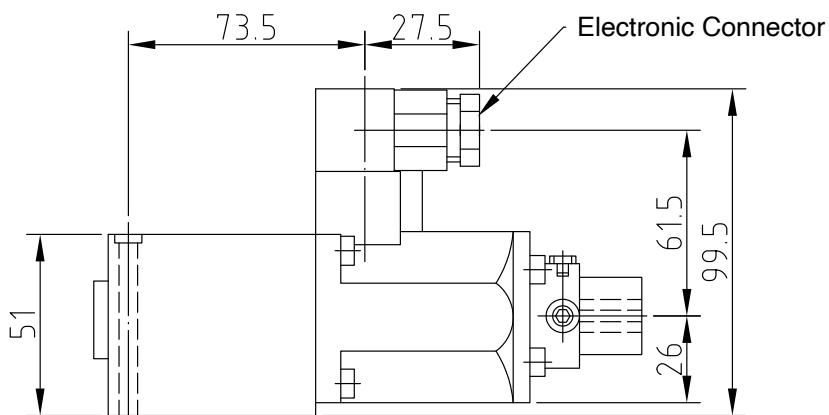

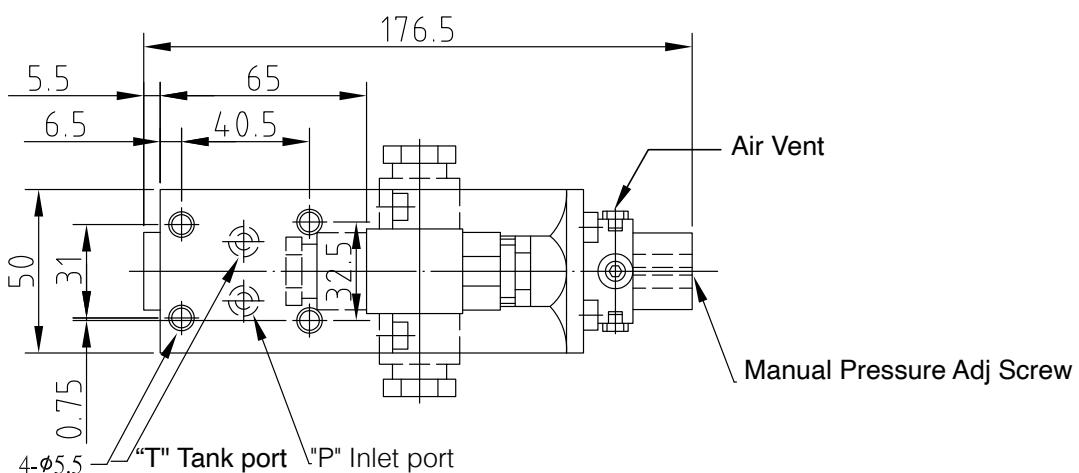

Instructions

- **Installation Position:** The air vent port must be upward. If the valve must be installed vertically, please contact our sales department.
- **Air Exhaust :** To stabilize the pressure, the air in the pipeline and the valve must be completely exhausted. Open the air vent screw to exhaust the air via upward vent port, and then lock the screw until there are no bubbles.
- **Manual Pressure Adjusting Screw:** When the electrical control fails and requires pressure, the manual pressure adjusting screw can be screwed in; it will return to its original position under normal conditions.
- **Oil Return line:** Please directly insert the return lines into the tank (below the oil level) to avoid the pipe from bending or resisting.
- **Pressure setting (Max.):** Based on actual output flow of the pump and actual operating pressure. Users are advised to add 15kgf/cm² when pump is under than 100 L/min.

Proportional Electro-Hydraulic Relief Valves

JIS-Graphic Symbol

Feature

- EBG valve is stable pressure and low noise.
- Combine traditional and micro-computer electrical control to achieve the best combination of hydraulic and electronic functions.
- High precision, easy fine-tuning, and shock pressures is small when pressure changes.

Specification

Model /Type	Rated Flow (Max.) L/min	Operating Pressure (Max.) Mpa	Allowable Back Pressure Mpa	Rated Current (mA)
EBG-03	100	21	Note	C : 750 H : 700
EBG-06	200			

Coil Resistance Ω	Hysteresis %	Reproducibility %	Weight Kg
10	< 3	< 0.5	7.1
			8.3

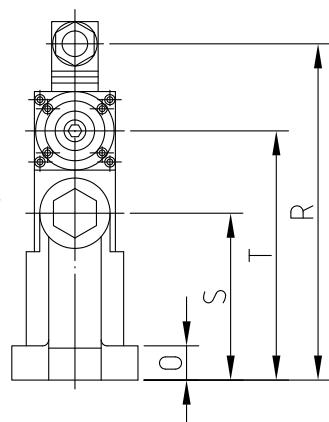

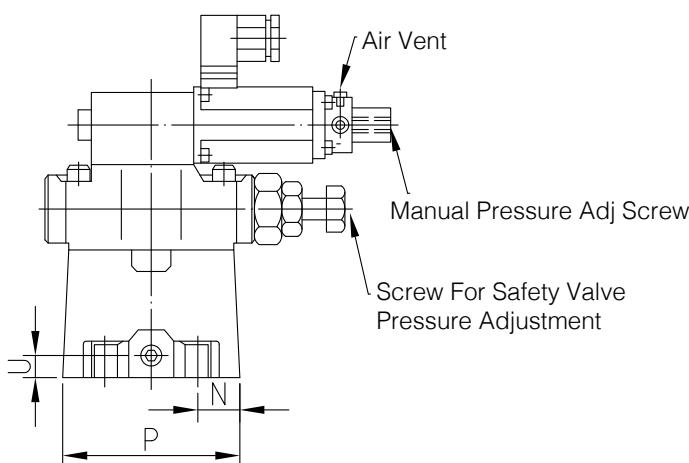

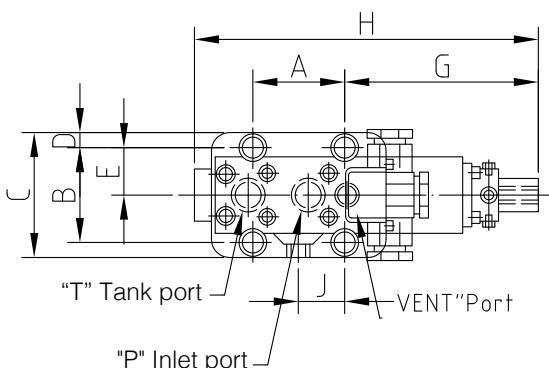

Note: The resistance of the return line should be cut down by using only one pipe insert into the tank (below the oil level) directly.

Hydraulic Automation System Designing & Power Unit Assembling

YUTIEN provides customized services to design various machine automation systems to suit the needs of various work environments. In addition, we warmly welcome our customers to choose YUTIEN's own products or to specify the brand components they require. We will always be willing to help customers create the best "Low noise, Power saving, High efficiency" power unit.

For available services, please contact our sales department, head office (Taiwan)
